III. EXPERIMENTS & ANALYSIS

A. Dataset

We test on an in-house dataset of 1.2K handwritten pages from nearly 100 writers. Every writer was given some topics to write upon, from a set of selected topics, without any constraints on time, amount of text or the content. As a writing style, we obtained a dataset which captured different handwriting styles, irrespective of the content. The documents were annotated on the basis of their neatness using a 5-point Likert scale, ranging from as poor, fair, average, good and excellent, with the worst and excellent denoting the best and worst assessment. For each document, two neatness quality factors were collected (each using the aforementioned Likert scale): (i) word neatness label, describing the quality of strokes and the handwriting (for a fine level assessment of strokes), and (ii) page neatness label describing the overall alignment of words, lines and paragraphs in the document (for a coarse level assessment of the document). In total we employed 18 human annotators and each page in the dataset was annotated by at least 3 different individuals. Figure 4 shows some sample page images from our corpus. One can observe the variation among different documents which makes the problem challenging.

Figure 1: An image is also here.

Elements

Lists

1. **Some numbered points** (however important)
→ have consequences
2. Others are more **important**
3. But have no consequences
4. Though multiple do
→ Not just one!

Elements

Quote

I am much more important than ordinary text. Like a research question? Or an important statement.

And then some explanations might be needed.
